

# EZ Jig Instruction Sheet

Simple ,clean even slices of your clay extruded pieces.

If your piece of clay is narrow, place it close to one side of your jig so that it does not move. If your piece of clay is the full width of the cutting surface, place it directly in the center of the aluminum plate.

Carefully place your cutting blade or rib tool in the first cutting slot. Draw the blade back toward yourself while cutting through the clay piece down to the aluminum plate.

- You can use each cutting slot or skip cutting slots to change the width of your slices
- Try to avoid handling your clay piece so you do not distort or crush it.
- To reposition your clay, slide the aluminum plate forward or back.
